ACKNOWLEDGEMENT

My first and foremost acknowledgements goes to the omnipotent almighty Allah (SWT) whose exalted blessings flourished my thoughts and guided me in my endeavor to come up with this thesis as a representation of my efforts which I commenced in tenure of my studies.

I am truly grateful to my supervisor Prof. Dr. Mohd Fadzil Ain for his invaluable supervision and guidance throughout my studies. Without his patience and continuous encouragement I won't think I could complete this research journey smoothly. I would like to extend my heartfelt gratitude to School of Electrical and Electronic Engineering University Sains Malaysia, Engineering Campus.

My humble gratitude is due to my co-supervisor Prof. Hj. Dr. Zainal Arifin Ahmad. His continuous support and skillful assistance during my lab work in School of Material and Mineral Resources Engineering, made me overcome all the stumbling blocks. Further, I would like to cordially thank my second co-supervisor Dr Nur Muzlifa Mahayyudin for her meaningful advice throughout my research activities.

I am deeply indebted to my parents, my brother Muhammad Haroon and my wife for their utmost attention and efforts to make my study successful. I would also like to extend my gratitude for their continuous moral support and devoted prayers, which kept my spirits high for the daunting tasks of life.

Many people have contributed to the development of this project. Special thanks go to my colleagues and friends Dr. Mohammadariff Othman, Abdurehman Javed

Shaikh, Mohammad Nishat Akhtar, Tariq Adnan and the entire lab technician who helped me develop and complete my project in a timely manner.

The author gratefully acknowledges financial support by the USM Global Fellowship Scheme and Grant under project no. 1001/PELECT/854004.

 CHAPTER ONE: INTRODUCTION	
1.1 Background	1
1.2 Problem Statement	5
1.3 Research Objectives	8
1.4 Scope of the Work	9
1.5 Research Contributions	10
1.6 Thesis Organization	11
 CHAPTER TWO: LITERATURE REVIEW AND THEORETICAL	
BACKGROUND	
2.1 Introduction	13
2.2 Dielectric Resonators and Antennas	16
2.3 Dielectric Resonator Antenna (DRA) Analysis Techniques	19
2.4 Introduction to Wideband DRA's	20
2.4.1 Dielectric Resonator Antennas Polarization	21
2.4.2 Linearly Polarized (LP) Wideband DRA's	22

2.4.3	Circularly Polarized (CP) DRA's	32
2.5	Cylindrical DR and its Electromagnetic Features	35
2.5.1	Modes in Cylindrical DR with Their Respective Far-Field Pattern	37
2.6	Field Approximation of Rectangular DRA's	42
2.6.1	Radiation Q-factor of Rectangular DRA's	45
2.7	The Feeding Mechanisms and Coupling to DRA's	49
2.7.1	Microstrip Line Coupling	52
2.8	Fabrication of Dielectric Materials	55
2.8.1	Mixing of the Raw Materials	56
2.8.2	Calcinations of the Mixed Powder	57
2.8.3	Pressing Powder into Shape	59
2.8.4	Sintering and Polishing	59
2.9	Dielectric characterization	60
2.9.1	X-ray Diffraction (XRD)	61
2.9.2	Dielectric Spectroscopy	62
2.10	Summary	63

CHAPTER THREE: DESIGN AND ANALYSIS OF LINEARLY POLARIZED (LP) INHOMOGENEOUS DIELECTRIC RESONATOR ANTENNA

3.1	Methodology	64
3.2	Inhomogeneous Cylindrical Dielectric Resonator	67
3.2.1	The Permittivity Effect	69
3.2.2	Sector Angles Effect	71
3.2.3	Mode Theory and Approximation of Inhomogeneous Cylindrical DR	73

3.2.3.1	Mode and Frequency Approximation of Cylindrical Sector DR	78
3.2.3.2	Mode Analysis of an Isolated Inhomogeneous Cylindrical DR	80
3.2.3.3	Mode Excitation and Feeding Mechanism of Inhomogeneous CDR	84
3.3	Inhomogeneous Split-oval Shape DR	88
3.3.1	Design Configuration and Mode Approximation	91
3.3.2	Mode Excitation and Feeding Mechanism of Split-Oval Shape DR	95
3.4	Inhomogeneous Nested Square Shape DR	99
3.4.1	Analytical and Numerical Solution of Nested Square DR	101
3.4.2	Modes Configuration of NSDR	104
3.4.3	Antenna Design of NSDR	109
3.5	Summary	111

CHAPTER FOUR: ANALYSIS OF CIRCULARLY POLARIZED (CP)

INHOMOGENEOUS DIELECTRIC RESONATOR ANTENNAS AND DIELECTRIC MATERIAL SYNTHESIS

4.1	Introduction	113
4.2	Dielectric Resonator Antenna and Circular Polarization	113
4.2.1	Circularly Polarized Inhomogeneous Cylindrical DR with Parasitic Slots	117
4.2.2	Circularly Polarized Inhomogeneous CDR Loaded on Top of a Wide Slot	120
4.2.3	Circularly Polarized NSDRA	126

4.2.3.1	Left Hand Circular Polarization (LHCP) and Right Hand Circular Polarization (RHCP)	128
4.3	Dielectric Resonator Material Synthesis	131
4.3.1	Composition Preparation	133
4.3.2	Mixing of Powder	134
4.3.3	Calcination Process	134
4.3.4	Pressing and Cutting to Shape	135
4.3.5	Sintering Process	137
4.3.6	Characterization	137
4.4	Experimental Characterization Steps for the Antennas	139
4.4.1	Impedance Bandwidth ($ S_{11} > -10$ dB) Measurement	139
4.4.2	Radiation Pattern Characterization	140
4.4.3	Antenna Gain Characterization	143
4.5	Summary	144
CHAPTER FIVE: RESULTS AND DISCUSSIONS		
5.1	Introduction	145
5.2	Dielectric Material Characterization Results	145
5.2.1	Structural Analysis	146
5.2.2	Electrical Characterization	147
5.3	Characterization of Inhomogeneous Cylindrical DRA (LP Results)	148
5.3.1	Impedance Bandwidth and Reflection Coefficient Characterization	149
5.3.2	Radiation Pattern Characterization	152
5.3.3	Power Flow, Efficiency and Gain Characterization	155
5.4	Characterization Results of Inhomogeneous Split-Oval Shape DRA	157

5.4.1	Impedance Bandwidth Characterization of Split-Oval Shape DRA	158
5.4.2	Radiation Pattern Characterization	159
5.4.3	Gain, Power Flow and Efficiency Analysis	162
5.5	Characterization Results of Inhomogeneous Nested Square DR	164
5.5.1	Impedance Bandwidth Characterization of NSDRA	165
5.5.2	Radiation Pattern Characterization of Inhomogeneous NSDRA	166
5.5.3	Gain Power Flow Pattern and Efficiency Analysis	169
5.6	Circular Polarization Results	171
5.6.1	Axial Ratio Bandwidth of Inhomogeneous CDR with parasitic slots	171
5.6.2	Radiation Pattern Characteristics of Inhomogeneous Cylindrical DR with Parasitic Slots	173
5.6.3	Axial Ratio Bandwidth of Inhomogeneous CDR Loaded on Wide Slot	174
5.6.4	Radiation Pattern Characteristics of Inhomogeneous CDR Loaded on Wide Slots	175
5.6.5	Axial Ratio Bandwidth of the Nested Square Shape DRA	177
5.6.6	Radiation pattern characteristics of Nested Square Shape DRA	177
5.7	Summary	180
 CHAPTER SIX: CONCLUSION AND FUTURE RECOMMENDATION		
6.1	Conclusion	182

KAJIAN PENYALUN DIELEKTRIK TAK HOMOGEN UNTUK APLIKASI ANTENA GELOMBANG MIKRO POLARISASI LINEAR/BULAT

ABSTRAK

Dalam tempoh tiga dekad yang lalu terdapat banyak penyelidikan telah didedikasikan untuk penyalun dielektrik (PD) homogen (ketelusan tunggal) dengan bentuk silinder, persegi/segi empat tepat dan bentuk hemisfera menjadi pusat tumpuan. PD ini telah disiasat secara teori, secara ilmiah dan uji kaji oleh itu, semua prestasi utama parameter pengawal untuk PD homogen adalah diketahui. Telah amat diketahui bahawa PD homogen boleh melakukan hanya satu tujuan pada satu masa iaitu gandingan kuat kepada punca dan oleh itu lebar jalur galangan adalah sempit dan sebaliknya. Untuk mengatasi kelemahan PD homogen, dalam kerja ini PD tak homogen direka bentuk dalam apa-apa cara bahawa geometri asas penyalun dikekalkan supaya alat penganalisis teori, berangka dan eksperimen yang ada boleh digunakan secara berkesan untuk PD tak homogen yang dicadangkan. Penyalun tak homogen ini diperkenalkan secara sistematik ke arah azimuth (ϕ) supaya taburan medan elektromagnet dalam penyalun tetap sama dengan pelbagai kurungan yang berlainan tenaga. Untuk mengesahkan idea-idea ini tiga penyalun yang berbeza berdasarkan penyalun dielektrik silinder (PDS) dan penyalun bentuk persegi/segi empat tepat disiasat. Untuk PDS dua sektor 90° berbentuk pai tak homogen dengan ketelusan yang tinggi diperkenalkan pada arah- ϕ dengan cara sektor yang mempunyai ketelusan sama diletakkan dalam kuadran yang bertentangan. Begitu juga, satu lagi PD tak homogen (bentuk bujur-berpecah) direka bentuk dengan memasukkan jalur segi empat tepat ketelusan tinggi di tengah-tengah dua PD separuh silinder arah ϕ . Akhir sekali, reka bentuk ketiga kajian ini adalah berdasarkan kepada

PD berbentuk persegi di mana ketelusan diturunkan dengan memperkenalkan jurang udara dalam penyalun yang kelihatan seperti PD persegi bersarang. PD tak homogen yang dicadangkan diuji untuk aplikasi antena jalur lebar polarisasi linear (PL) dengan teknik pengujian biasa iaitu garis mikrostrip. Manakala, untuk reka bentuk polarisasi bulat (PB), adalah penting untuk mengujakan dua mod ortogon dengan amplitud yang sama dengan itu teknik penyusunan yang berbeza digunakan. Analisis teori, berangka dan eksperimen antena penyalun dielektrik (APD) tak homogen menunjukkan bahawa dengan mereka bentuk dengan betul penyalun tak homogen, sambutan lebarjalur galangan, nisbah paksi (NP) lebarjalur, gandaan dan kecekapan APD boleh ditambahbaik. Bagi ketiga-tiga APD tak homogen PL ini lebihkurang 56% lebarjalur galangan telah dicapai yang menunjukkan peningkatan 80.5% daripada lebar jalur PD homogen dengan ciri-ciri sinaran stabil sepanjang jalur operasi. Sambutan NP lebarjalur PB tak homogen APD telah direkodkan menjadi 200% lebih daripada homogen. Untuk APD tak homogen yang pertama dan kedua gandaan telah meningkat sehingga 6.5 dBi manakala bagi PD persegi bersarang gandaan kekal hampir sama dengan PD persegi homogen. Dengan merujuk kepada penemuan ini didapati bahawa prestasi APD secara jelas bertambah baik dengan pengenalan sistematik ketakhomogenan dalam PD.

STUDY OF INHOMOGENEOUS DIELECTRIC RESONATORS FOR LINEARLY/CIRCULARLY POLARIZED MICROWAVE ANTENNA APPLICATIONS

ABSTRACT

In the last three decades a huge amount research has been dedicated to homogeneous (single permittivity) dielectric resonators (DRs) with cylindrical, rectangular/square and hemispherical shapes being the center of attention. These DRs have been investigated theoretically, numerically, and experimentally therefore, all the major performance controlling parameters are known for the homogeneous DRs. It well known that a homogenous DR can serve only one purpose at a time i.e. strong coupling to the source and hence narrow impedance bandwidth and vice versa. To overcome these drawbacks of homogenous DRs, in this work inhomogeneous DRs are designed in such a way that the basic geometry of the resonator is maintained so that the available theoretical, numerical and experimental analysis tools can be effectively applied to the proposed inhomogeneous DRs. The inhomogeneities in the resonators are introduced systematically in the azimuth (ϕ) direction so that the electromagnetic field distribution in the resonators remains the same with different range of energy confinement. To validate these ideas three different resonators based on cylindrical dielectric resonator (CDR) and rectangular/square shape resonators are investigated. For inhomogeneous CDR two 90° pie shape sectors of relatively high permittivity were introduced in the ϕ -direction in a way that sectors with same permittivity are placed in the opposite quadrant. Similarly, another inhomogeneous DR (split-oval shape) was designed by inserting high permittivity rectangular strip in the middle of two half cylindrical DR in the ϕ direction. Lastly, the third design of
